

SEE EVERYTHING EVERYTIME

The revolutionary device that illuminates every area to ensure greater success with every procedure, *everytime*.

THE SEE LIGHT IS THE **ANSWER**

Nurses and medical staff agree that the SEE LIGHT is the best way to reduce the risk of infections, keep the patients environment clear of unneeded staff, and most importantly improve accuracy of success while performing important and sensitive medical procedures on the human body.

95% of nurses participating in beta testing stopped using their common pen light and immediately switch to using the SEE Light.

100% of nurses participating in beta testing reported that they could perform invasive procedures without assistance, because of the SEE light.

“

Using the SEE Light for invasive procedures is the best way to help reduce cost, infections and maintain patient privacy.

”

Tanya Vaughn, RN, MSN, MHA

IT'S ABOUT THE
HEALTH
OF OUR PATIENTS

THE PROBLEM

Environmentally there usually isn't enough light available to perform invasive procedures on most orifices of the human body (like inserting a catheter). Because of this, practitioners typically use a pen light to light the area, which is less ideal, as it's held in mouth or hand, and the light is often dropped.

When something non-sterile like a pen light is dropped into the sterile field, the patient becomes at risk for infection; Nosocomial Infections [which can lead to death] being the most common. Also, to avoid dropping a pen light the practitioner usually calls in assistance to help with the procedure, compromising the comfort of the patient.

THE ANSWER

The SEE light illuminates areas of the body that are hard to see due to lighting inefficiencies, reducing risk of infection. Also, now nurses never need others to help with lighting, so they are able to perform invasive procedures alone, making patients more comfortable.

PROBLEM SOLVED

The SEE Light is the only product that solves this lighting issue that most nurses report to have dealt with since they started studying and practicing in the field.

The SEE Light is disposable, and comes individually wrapped and pre-sterilized.
Buy SEE individually or order in bulk!

SEE FACTS

The SEE light illuminates areas of the human body where medical interventions need to occur with accuracy. Placing tubes in a variety of orifices requires illumination of the area in which the patient remains comfortable and free from anxiety and stress throughout the entire procedure.

Nurses that participated in beta testing with the SEE light said using it was easy,

and they would never go back to using a pen light, because the number of Nosocomial infections has been reduced, providing improved medical outcomes and easing stress for all.

The light emitting diode (LED) apparatus incorporates into medical instruments namely, LED apparatus with snaps, and has an adhesive back pad that can be specially adapted to any medical situation or environment.

The SEE light is convenient. Practitioners are able to carry many at a time, for use in any application.

PAINFUL TRUTH

Before the SEE light, fellow nurses needed to assist with the lighting or other aspect of procedures because of visibility struggles. This kind of attention to the patient at such a vulnerable time was not ideal. And the added patient anxiety put more stress on the nurse to manage, while also needing to be cognitively available to complete invasive task.

Now, because of the SEE light, nurses and healthcare professionals perform invasive procedures with confidence because there's never any risk of dropping a pen light or losing visibility in hard to see places.

With the SEE light nurses have renewed confidence in performing invasive procedures and the risk of infection is reduced.

SEE was invented by a nurse who has decades of experience, to help others in healthcare fields, and to help save lives.
