

2006: Tallinn, Estonia

May 28, between 4:09 and 4:15 pm

Source: not declared on the web

It happened at in 16:09-16:15 in local time. On the sky there was a bright, little yellowish spot slowly moving from south to north (as big as normally Venus would be from Earth). The movement was stable and the illumination of the object didn't change during the observation. After approximately 6 minutes we lost the spot as it "melted" into a light blue horizon. I have been an amateur astronomer, so I know that it wasn't any planet, star, ball, meteorite. It possibly was some weather balloon (btw, the wind was blowing from 288 degrees, so not from south to north, but I don't know the data from higher levels).

Reliability evaluation:

- very high -

something really seen by witnesses;

apparently inconsistent as UFO; no investigation report;

possible test of military object
