Rotating Anode X-Ray Tube Housing Assembly

- High speed rotating anode X-ray tube housing assembly for high energy radiographic and cine-fluoroscopic operations.

- The heavy anode is constructed with specially processed rhenium-tungsten faced molybdenum target which is 74 mm diameter and has an improved coating to increase thermal emissivity.

- These tubes have foci 1.2 mm and 0.6 mm, and are available for a maximum tube voltage 150 kV with Three-phase generator.

- Accommodated with IEC60526 type high-voltage cable receptacles.

General Data

IEC Classification ................................................................................................................. Class I

Electrical:
- Circuit (Center-grounded) .............................................................................................. Three-phase full-wave rectified
- Nominal Tube Voltage:
  - Radiographic ............................................................................................................. 40 ~ 150 kV Max.
  - Fluoroscopic ............................................................................................................. 40 ~ 125 kV Max.
- Nominal Focal Spot Value:
  - Large Focus ............................................................................................................. 1.2 mm
  - Small Focus ............................................................................................................. 0.6 mm
- Nominal Anode Input Energy (at 0.1s):
  - Large Focus ............................................................................................................. 75 kW
  - Small Focus ............................................................................................................. 27 kW

Note:
1) The speed up time from normal speed of 3000 min⁻¹ (3600 min⁻¹) to high speed of 10800 min⁻¹ is 2/3 times of the specified speed up time from 0 to high speed, which is described on motor rating table.
2) To be applied for high speed rotation.
3) To be obtained with AID starter Model 60/180.
4) The every applied voltage must be never exceeded 110% of the above specification.
5) The speed-up time is allowed up to 110% of the above specification.

Stator impedance:

- Common-Main Winding: 27.5 Ω
- Common-Auxiliary Winding: 58.0 Ω

Anode Speed:

- 50 Hz: 2700 min⁻¹ Min.
- 60 Hz: 3200 min⁻¹ Min.
- 180 Hz: 9700 min⁻¹ Min.

Resistance between Housing and Low Voltage Terminals: 2 MΩ Min.

Normal operating range of the housing temperature: 16 ~ 75 °C
Mechanical:
- Dimensions: See dimensional outline
  - Overall Length: 476 mm
  - Maximum Diameter: 152.4 mm
- Target:
  - Angle: 12 degrees
  - Diameter: 74 mm
- Construction: Rhenium-Tungsten faced Molybdenum
- Permanent Filtration: 0.9 mm Al / 75 kV IEC60522 / 2003
- Radiation Protection (To meet the requirements of IEC 60601-1-3):
  - Leakage Technique Factor: 150 kV 3.4 mA
  - X-ray Coverage: 354 x 354 mm at SID 835 mm
  - Weight (Approx.): 18 kg
- High Tension Terminals: To meet the requirements of IEC 60526
- Cooling Method: Natural or forced air
- Tube Housing Model Number:
  - E7252X: XH-106V
  - E7252FX: XH-180
  - E7252GX: XH-181
Absolute Maximum and Minimum Ratings
(At any time, these values must not be exceeded.)

Maximum Tube Voltage:
Radiographic ................................................................. 150 kV
Fluoroscopic ................................................................. 125 kV

Maximum Voltage to Ground .............................................. 78 kV

Minimum Tube Voltage ..................................................... 50 kV

Maximum Tube Current:
Large Focus ........................................................................ 1000 mA
Small Focus ........................................................................ 400 mA

Maximum Filament Current:
Large Focus ........................................................................ 5.5 A
Small Focus ........................................................................ 5.2 A

Filament Voltage:
Large Focus (At max. filament current 5.5 A) ...................... 12.7 ~ 17.1 V
Small Focus (At max. filament current 5.2 A) ...................... 7.0 ~ 9.4 V

Filament Frequency Limits .................................................. 0 ~ 25 kHz

Average Input Power ......................................................... 142 W (200 HU/s)
(Fluoroscopic, repeated radiographic or mixed exposure)

Thermal Characteristics:
Anode Heat Content ....................................................... 210 kJ (300 kHU)
Maximum Anode Heat Dissipation Rate ............................. 475 W (667 HU/s)
X-ray Tube Assembly Heat Content .................................. 900 kJ (1250 kHU)

Maximum Housing Heat Dissipation Rate:
Without Air-circulator ................................................... 200 W (16 kHU/min)
Environmental Limits

Operating Limits:
Temperature ................................................................................................................ 10 ~ 40 °C
Humidity ..................................................................................................................... 30 ~ 85 %
(No condensation)
Atmospheric Pressure .............................................................................................. 70 ~ 106 kPa

Shipping and Storage Limits:
Temperature .............................................................................................................. -20 ~ 70 °C
Humidity ..................................................................................................................... 20 ~ 90 %
(No condensation)
Atmospheric Pressure .............................................................................................. 50 ~ 106 kPa
The information about EMC conformity (IEC60601-1-2 Ed2/2001)

As the result of reviewing the test requirements in the following Tables, an X-ray tube assembly as a component of X-ray system or apparatus does not fall within the scope of the EMC directive of IEC60601-1-2: 2001. Therefore, X-ray system manufacturer shall conduct the required test and evaluate EMC.

CAUTION: The diagnostic X-ray system can only allow to use the designated cables and components. If the different cables or components are used, they may deteriorate the performance of electromagnetic emissions and immunity.

The following tables are the copies of statements in IEC60601-1-2: 2001

Table 1 – Guidance and manufacturer’s declaration – electromagnetic emissions – for all EQUIPMENT and SYSTEMS (see 6.8.3.201 a) 3))

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>[E1] V/m</td>
<td></td>
</tr>
</tbody>
</table>

Recommended separation distance

\[
d = \frac{3.5}{\sqrt{P}} \quad \text{outside ISM bands}\] <sup>a</sup>

\[
d = \frac{12}{\sqrt{P}} \quad \text{in ISM bands}\] <sup>a</sup>

\[
d = \frac{12}{E1} \sqrt{P} \quad 80 \text{ MHz to } 800 \text{ MHz}
\]

\[
d = \frac{23}{E1} \sqrt{P} \quad 800 \text{ MHz to } 2.5 \text{ GHz}
\]

Where \( P \) is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and \( d \) is the recommended separation distance in meters (m)<sup>b</sup>.

Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey,<sup>c</sup> should be less than the compliance level in each frequency range<sup>d</sup>.

Interference may occur in the vicinity of equipment marked with the following symbol:

Continued to the next page.
Note: 1 At 80 MHz and 800 MHz, the higher frequency range applies.

2 These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, objects, and people.

a The ISM (industrial, scientific, and medical) bands between 150 kHz and 80 MHz are 6.765 MHz to 6.795 MHz; 13.553 MHz to 13.567 MHz; 26.957 MHz to 27.283 MHz; and 40.66 MHz to 40.70 MHz.

b The compliance levels in the ISM frequency bands between 150 kHz and 80 MHz and in the frequency range 80 MHz to 2.5 GHz are intended to decrease the likelihood that mobile/portable communications equipment could cause interference if it is inadvertently brought into patient areas. For this reason, an additional factor of $10/3$ is used in calculating the recommended separation distance for transmitters in these frequency ranges.

c Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the [EQUIPMENT or SYSTEM] is used exceeds the applicable RF compliance level above, the [EQUIPMENT or SYSTEM] should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as reorienting or relocating the [EQUIPMENT or SYSTEM].

d Over the frequency range 150 kHz to 80 MHz, field strengths should be less $[V_i]$ V/m.
Table 4 – Guidance and manufacturer’s declaration – electromagnetic immunity – for EQUIPMENT and SYSTEM that are not LIFE-SUPPORTING (see 6.8.3.201 b))

<td></td>
<td></td>
</tr>
</tbody>
</table>

Recommended separation distance

\[
d = \left\lfloor \frac{3.5}{V1} \right\rfloor \sqrt{P}
\]

Where \( P \) is the maximum output power rating of the transmitter in watts (W) according to the transmitter manufacturer and \( d \) is the recommended separation distance in meters (m).

Field strengths from fixed RF transmitters, as determined by an electromagnetic site survey,\(^a\) should be less than the compliance level in each frequency range\(^b\).

Interference may occur in the vicinity of equipment marked with the following symbol:

Note:
1. At 80MHz and 800MHz, the higher frequency range applies.
2. These guidelines may not apply in all situations. Electromagnetic propagation is affected by absorption and reflection from structures, object and people.

\(^a\) Field strengths from fixed transmitters, such as base stations for radio (cellular/cordless) telephones and land mobile radios, amateur radio, AM and FM radio broadcast and TV broadcast cannot be predicted theoretically with accuracy. To assess the electromagnetic environment due to fixed RF transmitters, an electromagnetic site survey should be considered. If the measured field strength in the location in which the [EQUIPMENT or SYSTEM] is used exceeds the applicable RF compliance level above, the [EQUIPMENT or SYSTEM] should be observed to verify normal operation. If abnormal performance is observed, additional measures may be necessary, such as reorienting or relocating the [EQUIPMENT or SYSTEM].

\(^b\) Over the frequency range 150kHz to 80MHz, field strengths should be less [V1] V/m.
Warning

Warning to Interface with X-ray Generator

1. Housing Rupture
   Never input over-rated power to x-ray tube assembly.
   If the input power is extremely higher than specification, it may cause the over temperature of anode, insert tube glass shatter and ultimately the following serious problems due to generating over-pressure by oil vaporization inside housing assembly.
   In such a critical condition, the safety thermal switch can not protect x-ray tube even if it works.

   * Housing sealing parts rupture
   * Human injury including burns due to hot oil escape
   * Fire accident due to flaming anode target

We strongly request that the x-ray generator should have a protective function which manages input power to x-ray tube assembly.
Caution to Interface with X-ray Generator

1. Over Rating
   X-ray tube assembly can be broken with applying just one over rated shot.
   Please read the technical data sheets carefully and follow the instructions.

2. Permanent Filtration
   The total filtration and the distance between x-ray focal spot and human body are regulated legally.
   They should be complied with the regulation.

3. Safety Thermal Switch
   X-ray tube assembly has safety thermal switch to prohibit further input power when the tube
   housing reaches to the temperature of switch-open.
   The switch should be hooked up with the x-ray generator which control output power to x-ray tube
   assembly.
   The switch is not recommended connecting stator coil in series circuit.
   Even if the switch works, never turn the system power off and the cooling unit should be activated.

4. Unexpected Malfunction
   X-ray tube assembly may have the risk to be unexpectedly malfunctioning due to life termination or
   failure. If the serious problems caused by the above risk is expected, we recommend to have a
   contingency plan to avoid such a case.

5. New Application
   If you use the product with new application not to be mentioned in this specification or with different
   type of x-ray generator, please contact to us for confirming its availability.
Caution for Installation, Adjustment and Maintenance

1. Qualified Persons
   Only qualified persons who have technical training and professional knowledge can handle x-ray tube assembly.

2. Fragile Glass
   X-ray tube is assembled with glass, therefore, it can be broken with the mechanical vibration or pulsed shock over 19.6m/s² (2G).
   Careful handling is required to treat or transport.

3. Ground Terminal
   X-ray tube assembly has ground terminal. Ground cable should be connected.

4. High Voltage
   All x-ray tubes operate at voltages high enough to kill through electrical shock. Never touch the high voltage delivered plugs or terminals.
   When direct access to such parts is required, the primary circuit should be disabled and high voltage capacitors/cables discharged.

5. High Voltage Plug
   High voltage plug should be cleaned up and free from any physical damages. Silicon compound application is required for high voltage stability.

6. Operation Atmosphere
   X-ray tube assembly is not allowed to use in the atmosphere of flammable or corrosive gas.

7. Protective Cover
   X-ray tube assembly is not allowed to use without the protective cover attached.

8. Handling
   Appropriate jig or tools are required for tube installation to avoid physical damages.

9. Returning Tube
   X-ray tube assembly should be repackaged with the original material when it is returned back for quality examination in our factory.
   Be careful to put the tube upside cathode. If the packaging is not proper, the tube may not be correctly examined.
Caution in Operation

1. X-Ray Radiation
   X-ray tube assembly should have the beam limiting equipment mounted on the x-ray port to protect unnecessary radiation.

2. Dielectric Oil
   X-ray tube assembly has dielectric oil contained for high voltage stability. As it is poisonous for human health, if it is exposed to the non-restricted area, it should be disposed as following to the local regulation.

3. Operation Atmosphere
   X-ray tube assembly is not allowed to use in the atmosphere of flammable or corrosive gas.

4. Lead Disposition
   X-ray tube housing is lined with lead to protect unnecessary radiation. As the lead powder or vapor is harmful for human health, it should be disposed as following to the local regulation or returned back to us with your cost of transportation. We dispose it in our facility with free of charge.

5. X-ray tube housing temperature
   Do not touch on X-ray tube housing surface just after operation due to high temperature.
   Stay X-ray tube to be cooled.

6. Any Malfunction
   Please contact to your system service person immediately, if any malfunction is noticed.
Caution Label

(a) This label is a caution label to notify the user of the following point.
"Housing end cap is used to protect the electric shock and x-ray leakage."

Attachment position: X-ray tube assembly housing end cap
