April 2017

Trailing Stars

The night sky will unveil untold treasures That you never though existed.
Long exposures make the stars swirl.
Bear in mind the stars don't move it is the earth rotating on its axis and
traveling around the sun , thus causing the illusion of moving stars .

For best success use a a tripod and a remote shutter release to help stabilize
the camera during the long exposure. Take several shoots from the same
location,

Long exposures are extremely hard on batteries always take an extra set.
Auto focus does not work in the night sky you must manually focus on a
bright object first.

Always use manual mode with a large aperture shutter speed 30 seconds
and an ISO of 1600, turn the auto noise reduction system off to prevent gaps
in the star trails.

Stay away from bright city lights , Shoot on a clear night with no cloud
cover. Have patience and make it a Memrise night, and have some fun

Training Courses
