

Golden Horseshoe Product Collection

Electro Paste

A premium electrolyte paste loaded with Potassium, Sodium, Magnesium, Chloride, Copper and Cobalt. Use to recharge electrolyte levels before and after workouts and races. Very easy to administer orally or on feed.

Electrolytes are minerals essential for optimal performance and stamina, reducing premature muscle fatigue, cramping, risk of tying up and diaphragmatic flutter or thumps, and improves post race recovery time. They perform critical functions involving muscle contractions, transmission of nerve signals, monitoring of fluid levels, filtering of waste products, pH balance, cardiac and respiratory function, and proper digestion and nutrient utilization.

Electrolyte imbalances can occur when horses sweat >10 litres/hour or during extended periods. By not replacing fluid loss and electrolytes, especially during hot summer days, not only will performance be hindered, but risk of heat stress and heat exhaustion could develop with serious life threatening results such as decreased blood pressure, narrowing of blood vessels and impaired heart function, kidney and liver shutdown.

Electro Paste is an easy to administer oral paste providing balanced levels of the major electrolytes, Sodium, Chloride, Potassium, Magnesium and Calcium which are lost in sweat and urine during training or competitions and are especially important for horses on the diuretic, Furosemide or Lasix.

For best results, ensure horse is fully hydrated pre and post event after adequate cool down.

**Available Size:
80gr Syringe**
