

Global emissions have to decline rapidly from 2020 – at the very latest

2020 applies to 1.5°C & 2°C. Graphics from the published science are adapted for simplicity. All text is as published. Red arrows mark 2020 (some have emissions declining before 2020). CO2e(q) equivalent includes the other GHGs with CO2. Originally the 2°C limit was equilibrium warming (long after 2100). Since 2007 2°C is a target by 2100.
