

Using an advanced tracking system to understand the movement and breeding ecology of the Little Swift (*Apus affinis*)

Itai Bloch & Nir Sapir

- **Introduction**
- Research hypothesis
- Methods and materials
- Results

Introduction - study species: Little swift

Little swift - *Apus affinis*

- *Apus affinis galilejensis*
- Colonies of dozens to hundreds of couples
- Part of the flock sleeps in the colony
- Aerial Insectivores

Introduction - study species: Distribution

BirdLife International (2004). Detailed species account from Birds in Europe: population estimates, trends and conservation status.

Introduction - Animal movement: Scale

Small scale - minutes / hours

Medium Scale - days / weeks

Large scale - months / years

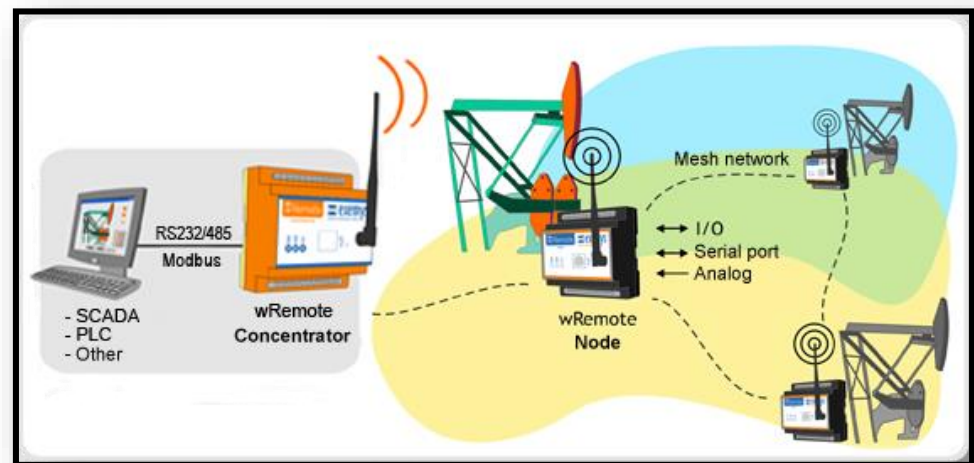

Introduction - Animal movement: Measurement

Introduction – The ATLAS system

- **ATLAS** **A**dvanced **T**racking and **L**ocalization of
Animals in real-life **S**ystems
- Reverse GPS – 1 g tags
- Real-time / retrospective viewing

Hypothesis

The movement of Little Swifts and their nest visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits
- Duration of stay in the nest during the night
- Foraging range

Hypothesis

The movement of Little Swifts and their nest visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits
 - Duration of stay in the nest during the night
 - Foraging range
-
1. Location transmitters (ATLAS tags)
 2. Comparing the number of visits during the breeding season

Hypothesis

The movement of Little Swifts and their nest visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits
- Duration of stay in the nest during the night
- Foraging range

Hypothesis

The movement of Little Swifts and their nest visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits
 - Duration of stay in the nest during the night
 - Foraging range
-
1. Location transmitters (ATLAS)
 2. Location at night during the breeding season

Hypothesis

The movement of Little Swifts and their nest visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits
- Duration of stay in the nest during the night
- Foraging range

Hypothesis

The movement of Little Swifts and their nest visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits
 - Duration of stay in the nest during the night
 - Foraging range
-
1. Location transmitters (ATLAS tags)
 2. Foraging range during the breeding season

Hypothesis - Predictions

The movement of Little Swifts and their nests visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits –
- Duration of stay in the nest during the night –
- Foraging range -

Hypothesis - Predictions

The movement of Little Swifts and their nests visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits - **will increase**
- Duration of stay in the nest during the night –
- Foraging range -

Hypothesis - Predictions

The movement of Little Swifts and their nests visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits - will increase
- Duration of stay in the nest during the night - will decrease
- Foraging range -

Hypothesis - Predictions

The movement of Little Swifts and their nests visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits - will increase
- Duration of stay in the nest during the night - will decrease
- Foraging range - will remain unchanged

- **Results**

Results

The Swifts colony area

Results

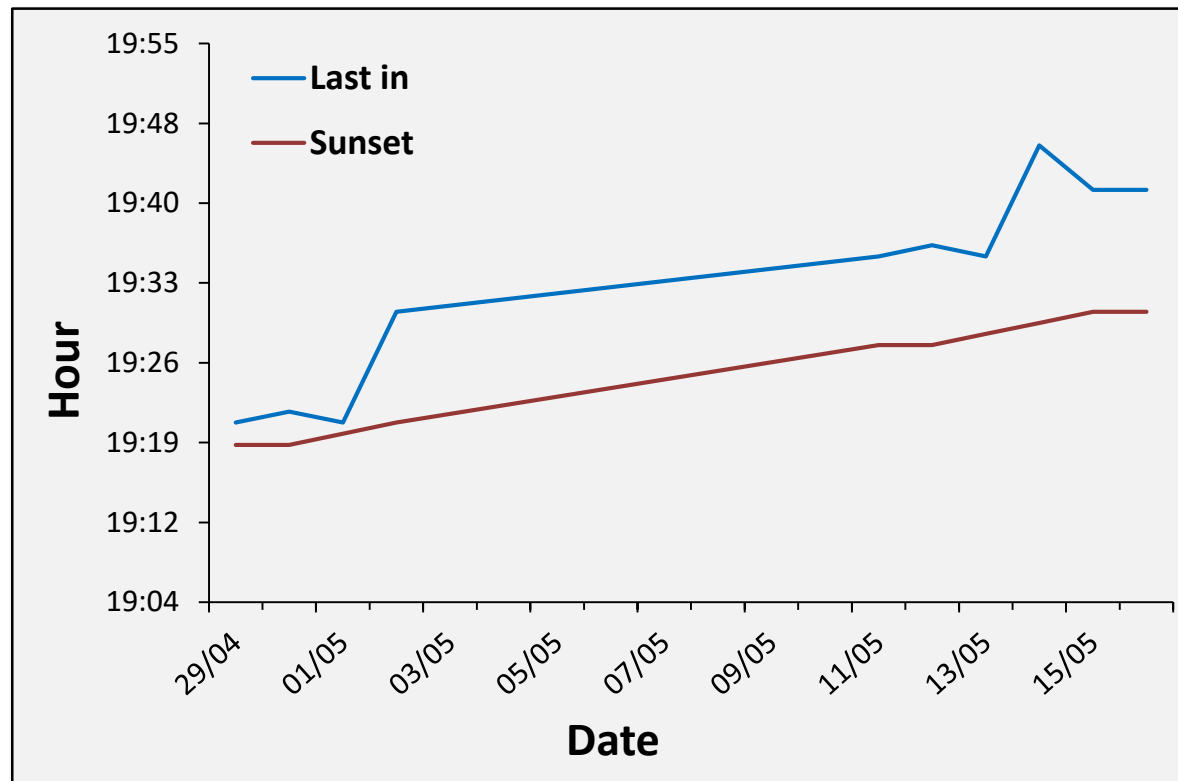

Movement of a single individual for 3 hours

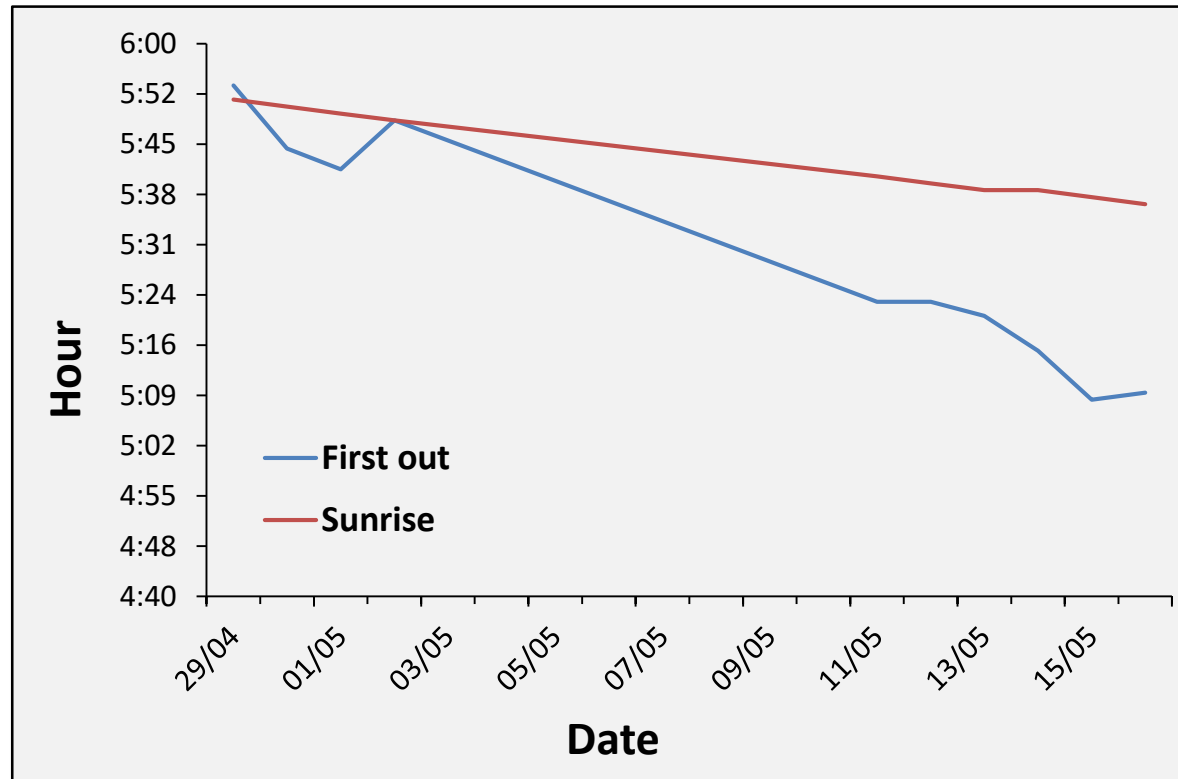

Results – Foraging range

Results - Entrance to the colony

Results - Departure from the colony

Results - Visit frequency and foraging range

Results - Visit frequency and foraging range

Hypothesis - Summary

The movement of Little Swifts and their nest visits will vary during the breeding season.

These changes will be reflected in:

- Frequency of nest visits – Decline observed
- Duration of stay in the nest during the night – Decline observed
- Foraging range – Increase observed
